Operative System:	All		
Description			
Hello,			
When i specify into the \$input() the 'b' parameter the X button up right doesn't seems to follow correctly the 'disable' option and is able to close the input window before the input leaves the 'disable' state and make all buttons/items visible again, i think and the X red window button should be good to be disabled for 3 seconds within the other input items too, because now someone can close it fast and the 'b' isn't helping in that case.			
Example Code: <code>//noop \$input(test message,oidb,test)</code>			
- Thanks!
