

AdiIRC - \$! - # 2

Added in 1.9.0

\$!

Can be used to delay evaluating a identifier, useful in commands such as [/timer](#).

Each evaluation will remove a '!' prefix.

Example

```
; Evaluate to $me instead of nick.  
//echo -ag $eval($!me) vs $eval($me)
```

```
; Evaluate to $!me instead of $!me.  
//echo -ag $eval($!!me) vs $eval($!me) vs $eval($me)
```

```
//timer 5 1 echo -a this always show the time at timer launch $asctime  
//timer 5 1 echo -a this always show the new time at each timer execution $!asctime
```
