

AdIRC - \$date - # 5

Added in 1.9.0

\$date

Returns current date in dd/mm/yyyy format. See [\\$adate](#) for mm/dd/yyyy format.

This is the same as \$asctime(\$ctime,dd/mm/yyyy) and you can also format the current time differently like \$date(yyyy-mm-dd) or format a different time like \$date(1234567890) or \$date(1234567890,yyyy-mm-dd HH:nn:ss). If the date falls during the 1900's, the year defaults to show as 2 digits.

In effect, it's the same as \$asctime except having a different default format.
