

AdiIRC - \$null - # 1

Added in 1.9.0

\$null

If a variable is referred to and it does not exist, it returns the value \$null. The \$null value can be used in comparisons in if-then-else statements to control branching etc.

Example

```
; Check if NonExistingNick is in the current channel.  
//if ($nick(#, NonExistingNick) == $null) echo -ag NonExistingNick was not found
```
