

## AdiIRC - \$remtokcs - # 2

*Added in 1.9.0*

### **\$remtokcs(text,token,N,C)**

Removes the Nth matching token from text.

[\\$remtokcs](#) is case-sensitive, see [\\$remtok](#) for case-insensitive version.

### **Parameters**

text - The text to tokenize.

token - Token to add.

N - If N = 0, all matching tokens, otherwise the Nth token.

C - The [ASCII](#) value to tokenize by.

### **Example**

```
; Remove the first 'B' token.  
//echo -ag $remtokcs(a.b.B.c.d,B,1,46)
```

```
; Remove all 'B' tokens.  
//echo -ag $remtokcs(a.b.B.B,b,0,46)
```
