

AdiIRC - \$sockname - # 2

Added in 1.9.0

\$sockname

Returns the name of a socket during [on SOCKCLOSE](#), [on SOCKLISTEN](#), [on SOCKOPEN](#), [on SOCKREAD](#) and [on SOCKWRITE events](#).

Example

```
; Open a socket connection to 'google.com' port '80'.  
/sockopen Example www.google.com 80
```

```
; Listen for the on SOCKOPEN event.  
on *:SOCKOPEN:*:{  
    ; Print the name of the socket.  
    echo -ag Socketname is $sockname
```

```
; Close the socket.  
sockclose $sockname  
}
```
