

AdiIRC - Alias - # 11

Added in 1.9.0

/alias [-l] [filename] <aliasname> <command>

Add/remove/replace any single or multi line (**AdiIRC only**) alias.

Switches

-l - Adds a local alias only available from current script.

Parameters

[filename] - An optional alias filename to update, if no filename is specified it will use the first match or the first loaded alias file.

<aliasname> - Name of the alias to add/remove/replace.

<command> - The command(s) to be executed by the aliasname.

Example

```
; This will replace the first matching alias with the new command.  
/alias /hello /me says hello
```

```
; To remove an existing alias:  
/alias /hello
```

```
; If you want to add/remove/replace a alias in an existing file  
/alias hello.txt /alias /me says hello
```
