

AdiIRC - Me - # 8

Added in 1.4.6

/me <message>

Sends an emote/action message to current active channel or private window. It's the command used by the 'fish slap'.

See also [/describe](#), [/ame](#), [/msg](#), [/nmsg](#), [/omsg](#), [/notice](#), [/onotice](#).

Parameters

<message> - The emote/action message to send.

Example

```
; Sends 'Hello world' to the current active channel or private window.  
/me Hello world.
```

This command is intended to be typed into the channel/query editbox. While it can be used in a script, it uses whichever is the active window. The script would likely want to use:

```
/describe nick|#channel Hello world
```
