

AdiIRC - Rawx - # 10

Added in 1.9.3

/rawx [-nq] <command>

Sends the specified command directly to the server. You must know the correct raw format of the command you are sending.

Same as [/raw](#) but evaluates a variable instead of text and allows sending consecutive spaces.

Switches

-n - Prevents characters in the range 0-255 from being UTF-8 encoded, as long as the line contains characters only in the range 0-255.

-q - Makes the command work quietly without printing what it is sending.

Parameters

<command> - The command to send to the server.

Example

```
;Create a variable with the text PRIVMSG #channel :a b
/var %var PRIVMSG #channel :a $+ $chr(32) $+ $chr(32) $+ $chr(32) $+ $chr(32) b
```

```
;Sends the output of %var to the server.
/rawx %var
```

```
;Add a on INPUT event that listens for /example command.
on *:INPUT:*.if ($1 == /example) {
```

```
;Put the consecutive spaced message into a variable
var %text PRIVMSG # : $+ $mid($msgx, $calc($len($1) + 2), $len($msgx))
```

```
;Send the message
/rawx %text
}
```
